

Build Your Own Ansible Lab

The instructions below will guide you through building your Ansible lab using Vagrant. This approach works seamlessly on Windows, Intel Macs, and Apple Silicon Macs. Instead of manually creating virtual machines, which can lead to compatibility issues on newer systems, we automate the process using Vagrant.

Why Use Vagrant?

Vagrant simplifies the creation and management of virtual machines by automating tasks like provisioning and configuration. It supports:

- VirtualBox for Windows and Intel Macs
- VMware Fusion for Apple Silicon Macs

This updated method ensures compatibility, reduces errors, and provides a faster setup.

Steps to Set Up Your Lab

1. Follow the detailed instructions in the official GitHub repository:
2. [Learn Ansible Basics - Vagrant Setup](#) This setup uses:
 - CentOS 9 as the base operating system
 - The latest version of Ansible
 - Automation powered by Vagrant

Key Benefits

- Tested and works across Windows, Intel Macs, and Apple Silicon Macs.
- Supports both VirtualBox and VMware Fusion, ensuring cross-platform compatibility.
- Automates the VM creation process, saving your time and effort.

By following these updated instructions, you'll have a reliable and fully functional Ansible lab environment up and running quickly.
